

Amkor Technology

Advanced packaging at the mix inflection - and the comp that hides it

NASDAQ: AMKR | Outsourced Semiconductor Assembly & Test

1 EXECUTIVE SUMMARY

Amkor Technology sits in the back end of the semiconductor supply chain. Foundries such as TSMC and integrated device manufacturers such as Infineon or NXP produce finished silicon wafers; Amkor takes those wafers on consignment, cuts them into individual dies, connects those dies to the outside world, encases them in a protective package, tests them electrically, and ships the finished component to the customer's contract manufacturer. It owns no fabs, designs no chips, and takes essentially no inventory risk on the silicon itself. It is the largest US-headquartered member of the outsourced semiconductor assembly and test (OSAT) industry and the number two player globally behind Taiwan's ASE Technology Holding.

The investment thesis is a margin thesis, not a revenue thesis. Amkor's gross margin has moved from 12.0% in Q2 2025 to 16.8% in Q2 2026, with management guiding 18.5-19.5% for Q3 2026 - a level not seen since the 2021 peak - driven by factory utilisation and a mix shift into 2.5D and high-density fan-out packaging for artificial-intelligence (AI) accelerators. Against that, the top line is about to look much worse than the business: the Q3 2026 revenue guide of US\$1.95-2.05bn represents roughly flat year-on-year growth against the toughest quarterly comparison in the company's history, immediately after two quarters of +27% and +26%. The central question for this name is whether an investor is willing to underwrite a US\$2.5-3.0bn capital programme, negative free cash flow, and a 2028 revenue start date at the Arizona facility, in exchange for contracted advanced-packaging relationships with TSMC, NVIDIA and Apple that no other OSAT outside Taiwan possesses.

Ticker / exchange: AMKR (Nasdaq Global Select)	HQ: Tempe, Arizona, USA
Market cap: US\$13.8-13.9bn (248m shares at US\$55.59, 12 Aug 26)	52-week range: US\$20.87 - US\$96.68 (single source; see log)
Revenue (TTM to Jun-26): US\$7,458m, +17.9% y/y	Revenue (FY2025): US\$6,708m, +6.2% y/y
Gross margin: TTM 15.5%; Q2 2026 16.8%; FY2021 peak 20.0%	Operating margin: TTM 8.6%; Q2 2026 10.5%
Q3 2026 guidance: Sales US\$1.95-2.05bn; GM 18.5-19.5%	Q3 2026 EPS guidance: US\$0.72-0.82 diluted
FY2026 capex guidance: US\$2.5-3.0bn (vs US\$905m in FY2025)	Diluted share count: 250.0m (Q2 2026); basic 247.9m
Net debt: ~US\$26m (cash + ST inv US\$2,512m vs debt US\$2,486m)	Dividend: US\$0.08352/qtr; ~0.6% yield
CEO: Kevin Engel (since 1 Jan 2026; 22 yrs at Amkor)	Control: Kim family 49.4% beneficial (13D/A, May 2026)
Advanced products mix: 83.0% of TTM revenue (vs 71.8% in FY2021)	Next earnings: 26 Oct 2026 (est., Q3 2026)

Three things distinguish this initiation from the sell-side framing of the name. First, the much-discussed 'record quarter' in Q2 2026 was a record second quarter, not an all-time record - Q3 2025 was larger, and that is exactly why the Q3 2026 guide looks weak. Second, Amkor's advanced-products mix rose from 75.7% to 82.8% of revenue between FY2022 and FY2025 while gross margin fell from 18.8% to 14.0%, which means the 'advanced packaging equals higher margin' equation is not mechanical - utilisation does most of the work. Third, the label 'US-headquartered OSAT' describes a legal domicile, not a manufacturing footprint: essentially all of Amkor's capacity today is in Asia and Portugal, and the Arizona plant does not produce revenue until 2028.

This report follows house convention: no price target and no buy, sell or hold recommendation. Every material claim is graded in the Verification Log at Appendix A.

2 TECHNOLOGY DEEP-DIVE

ELI5 — What Amkor actually sells

Imagine a chip factory produces a wafer covered in hundreds of tiny, fragile silicon squares. Each square is useless on its own: it is thinner than paper, has electrical contacts too small to see, and will shatter or corrode if touched. Amkor is the company that turns each square into something you can actually solder onto a circuit board. It cuts the wafer up, builds a tiny scaffolding of wires and contacts around each die, glues several dies side by side if the customer wants them to talk to each other at high speed, encases the whole assembly in hard plastic, and then plugs it into a testing machine to check every connection works. Historically this was the cheap, unglamorous last step. In the AI era it has become one of the hardest engineering problems in the industry, because the wires between the dies now determine how fast the chip runs.

The physics matters here, so it is worth being precise. In a conventional package, a die sits on an organic laminate substrate and communicates with the outside world through solder bumps and copper traces routed through that substrate. The trace lengths are millimetres. For a processor talking to its own memory across a printed circuit board, that is acceptable. For a graphics processing unit (GPU) talking to a stack of High Bandwidth Memory (HBM) at multi-terabit-per-second rates, it is not: at those frequencies a millimetre of organic trace introduces enough insertion loss, impedance mismatch and capacitive load that the link either fails or burns unacceptable power. The engineering answer is to shorten and densify the interconnect, and there are exactly three ways to do it.

The first is a silicon interposer with through-silicon vias (TSVs): a slab of silicon, patterned with the same lithography used to make chips, sits under both the logic die and the memory stacks and carries the signals between them. Because the wiring is defined lithographically in silicon rather than printed in organic resin, line widths drop into the low single-digit micrometres and the logic-to-HBM distance falls below 100 micrometres. This is the 2.5D architecture; TSMC's CoWoS-S is the best-known implementation and Amkor runs its own 2.5D TSV line. The second is high-density fan-out (HDFO): instead of silicon, the fine wiring is built directly on the dies using organic dielectrics and a redistribution layer (RDL), which is a stack of lithographically patterned copper wiring layers. Amkor's implementation, S-SWIFT (Substrate Silicon Wafer Integrated Fan-out Technology), reaches 2-micrometre line and 2-micrometre space routing across up to six RDL layers, supports more than 1,000 input/output connections, and accepts copper pillar die interconnects down to 30-micrometre pitch. It is cheaper and thinner than a silicon interposer and has lower warpage, at the cost of some routing density. The third is a bridge: a small silicon chip embedded inside an otherwise organic package, used only where two dies need to talk densely to each other. Amkor's version is S-Connect, which combines HDFO with an embedded silicon bridge die and additionally allows integrated passive device (IPD) capacitors to be placed directly under the power delivery path. Intel's EMIB and TSMC's CoWoS-L are the competing bridge architectures.

Product line	What it is / key specifications	Competes against
S-SWIFT (HDFO)	Substrate Silicon Wafer Integrated Fan-out. Organic high-density interposer; 2 um line / 2 um space RDL; up to 6 RDL layers; >1,000 I/O; Cu pillar down to 30 um pitch; fan-out module treated as a single die then mounted on a BGA substrate. Qualified for chiplet plus HBM integration.	TSMC CoWoS-R / InFO, ASE FOCoS, Samsung I-Cube
S-Connect	HDFO plus embedded silicon bridge die for die-to-die links; offloads the densest routing from the fan-out layer to the bridge; IPD capacitors positioned for power delivery; extensible to large modules. In internal qualification.	Intel EMIB, TSMC CoWoS-L, ASE FOCoS-Bridge

Product line	What it is / key specifications	Competes against
2.5D TSV	Silicon interposer with through-silicon vias; logic-to-HBM spacing reduced to under 100 um by mounting both directly on the interposer. Highest density, highest cost, largest package area.	TSMC CoWoS-S, Samsung I-Cube, ASE 2.5D
SWIFT / HDFO (wafer-level)	Wafer-level fan-out with polymer dielectrics; 2/2 um line/space via stepper lithography; multi-die and large-body capability; meets JEDEC MSL2a/MSL3 moisture sensitivity.	TSMC InFO, ASE FOCoS, JCET fan-out
Flip Chip BGA / CSP	The volume workhorse: die flipped and bumped onto an ABF laminate substrate. Carries most HPC, GPU, CPU and networking volume that does not need 2.5D. Substrate layer counts escalating from 3+3 toward 13+13 build-up layers.	ASE, SPIL, Tongfu, JCET
Wafer-level CSP, bump and probe	Chip-scale packages formed at wafer level; wafer bumping, backgrind and wafer probe sold as standalone or turnkey steps.	ASE, Powertech, JCET, KYEC (probe)
System-in-Package (SiP)	Multiple heterogeneous components (logic, memory, passives, RF) assembled into one module; double-sided molding. The core of the smartphone/wearable business. Currently migrating from China/Korea to Vietnam.	ASE (SiP leader), USI, JCET
Memory packaging	Reported inside Advanced products. Stacked memory assembly and related test.	Powertech, Hana Micron, SK hynix in-house
Mainstream wirebond	Leadframe QFN/QFP and multi-chip modules using gold or copper bonding wire. Automotive, industrial, analogue. 17.0% of TTM revenue and shrinking as a share.	Tongfu, JCET, HT-Tech, UTAC
Test services	Wafer probe, final test, burn-in and system-level test. 12% of Q2 2026 revenue; the remaining 88% is packaging.	KYEC, ChipMOS, customer in-house test

ELI5 — Why the AI cycle changes the economics

Think of packaging as picture framing. For twenty years Amkor framed millions of small, cheap photographs, and competed almost entirely on price per frame. An AI accelerator is not a photograph - it is a mural. It needs a frame the size of a dinner plate, built from a dozen laminated layers, with eight memory stacks mounted around the edge to sub-micrometre tolerances, and if any one connection fails the whole thing - including thousands of dollars of customer silicon - is scrap. Customers will pay a great deal more for that frame, and they cannot easily switch framers, because requalifying takes a year or more. That is the shift in the demand profile.

The quantified version of that shift runs through four channels. Content per unit: substrate build-up layer counts for AI packages are escalating from 3+3 through 11+11 toward 13+13, and each AI GPU requires one or two large ABF substrates of 70x70mm or greater, versus a mobile application processor substrate an order of magnitude smaller in area. Average selling price: industry estimates place advanced packaging technologies - fan-out, 2.5D interposer, chiplet integration and HBM stacking - at roughly three to ten times the ASP of traditional packaging, and put those technologies at 25-30% of OSAT revenue in 2026 versus around 15% in 2020. These are vendor and consultancy figures and should be treated as directional rather than precise. Difficulty: advanced substrates above twelve layers with sub-8-micrometre line/space run at 60-70% yield, which means the value of process know-how rises sharply relative to the value of cheap labour. Capital intensity: Amkor's FY2026 capex guidance of US\$2.5-3.0bn against roughly US\$7.5-7.8bn of revenue is 33-40% capital intensity, versus 13.5% in FY2025 and management's own long-term target of the mid-to-high teens.

The mix evidence in Amkor's own disclosure is unambiguous. Advanced products - flip chip, memory and wafer-level processing plus related test - were 71.8% of revenue in FY2021 and 83.0% of TTM revenue to June 2026. In Q2 2026 they were US\$1,557m of US\$1,898m. But here is the part the bull case usually skips: between FY2022 and FY2025 the advanced mix rose from 75.7% to 82.8% while gross margin fell from 18.8% to 14.0%. Mix alone does not create margin. What creates margin at Amkor is utilisation of a very high fixed-cost asset base, and the 2026 recovery is best read as utilisation returning with mix as an amplifier, not the other way round. Depreciation fell from 9.6% of sales in Q2 2025 to 8.6% in Q2 2026 on a larger revenue base, which is the arithmetic signature of that effect.

3 SUPPLY CHAIN MAPPING

ELI5 — Where Amkor's money goes

Amkor does not buy the chip - the customer supplies that free of charge. What Amkor does buy is everything that surrounds the chip: the laminated board it sits on, the film that separates the wiring layers inside that board, the metal wires and solder balls, the plastic that encases it, and the machines that assemble and test it. Those bought-in materials are 52.6% of every dollar of revenue. That is more than half the income statement sitting in a purchasing department, which means supplier pricing is not a footnote to the margin story - it is a large part of the margin story.

Supply chain layer	Key suppliers	Single source?	Risk to Amkor
Build-up dielectric film (ABF)	Ajinomoto (Japan)	Yes - est. >95% share	Structural monopoly on the insulating film inside every flip-chip substrate. A ~30% price increase was announced effective Q3 2026. No qualified alternative exists at scale; a successful Sekisui or Chinese qualification would be the first crack in a 26-year monopoly.
FCBGA / ABF substrates	Unimicron, Ibiden, Shinko, Nan Ya PCB, Kinsus, AT&S, Samsung Electro-Mechanics	No, but top five hold est. ~75% of volume	Back in shortage since H1 2026; lead times est. 20-30 weeks versus a 12-16 week norm; ABF/BT substrate prices up 5-10% for contract and over 30% on spot. New lines take 18-24 months. This is both a cost headwind and a volume ceiling.
Copper-clad laminate and core	Resonac, Mitsubishi Gas Chemical	No	Both announced ~30% price increases, compounding the ABF move on the same bill of materials.
Silicon interposers / TSV wafers	Foundry-sourced, principally TSMC	Effectively concentrated	For 2.5D work the interposer supplier is also the most credible competitor. This is the single most awkward dependency in the model.
Bonding wire and bump metals	Heraeus, Tanaka, Nippon Micrometal; solder and copper suppliers	No	Commodity metals largely pass through, but gold-wire exposure in the mainstream wirebond book is a real margin sensitivity in a high gold price environment.
Encapsulant / mold compound	Sumitomo Bakelite, Resonac, Henkel	No	Qualification-locked per package family; switching is slow but not structurally blocked.
Assembly and test equipment	ASMPT, BESI, Kulicke & Soffa, Disco, Tokyo Electron, Shinkawa; testers from Advantest and Teradyne	No, but slot-constrained	Amkor's US\$2.5-3.0bn 2026 capex competes for the same tool slots as ASE's much larger programme (raised to est. ~US\$10.5bn). Tool lead times, not capital, are the binding constraint in an upcycle.
Silicon wafers	Customer-consigned	n/a	Amkor takes no silicon inventory risk, but customer wafer availability directly gates Amkor's revenue timing - the Q2 2026 Android weakness was explicitly attributed to memory supply dynamics.

Geographic exposure deserves a blunt statement. Amkor operates manufacturing in Korea, the Philippines, Vietnam, China, Japan, Malaysia, Taiwan and Portugal, with headquarters in Tempe, Arizona. Korea is the largest manufacturing base. The Peoria, Arizona facility - first building targeted for completion around mid-2027 with production from early 2028, supported by up to US\$400m of direct CHIPS and Science Act funding - is the first meaningful US capacity. Until that runs, the 'largest US-headquartered OSAT' framing describes where the board meets, not where the product is made. The genuine structural advantage today is not American manufacturing but the absence of Taiwan concentration: Amkor is the only scale advanced-packaging supplier whose footprint is not dominated by a single strait.

Input cost sensitivity is quantifiable at the margin line. Materials ran at 52.6% of net sales in Q2 2026, 53.5% in Q1 2026 and 52.9% in Q2 2025 - remarkably stable, which suggests Amkor has so far passed substrate inflation through. The test of that comes in H2 2026 as the Ajinomoto and laminate increases land. As illustrative arithmetic only: on roughly US\$4.0bn of annualised materials spend, a 3-6% increase in finished substrate cost - the pass-through estimated from a 30% ABF film increase, since film is only 10-15% of

substrate bill of materials - is around US\$120-240m, or 1.5-3.0 percentage points of gross margin if fully absorbed. Management's guide to 18.5-19.5% for Q3 implies they expect to pass most of it on.

4 COMPETITIVE LANDSCAPE

ELI5 — The shape of the industry

Picture ten specialist workshops that finish other people's products. One of them is roughly three times the size of the next and takes almost half of all the work. Amkor is the second workshop: about a third of the leader's size, but the only one that is not clustered in the same city as the leader, which matters enormously to customers who worry about that city. Three Chinese workshops are growing much faster than everyone else because their government is paying for the machines - but they have been quietly locked out of the highest-value Western jobs. And looming over all of them is the chip factory itself, which has started doing the finishing work in-house and keeping the best-paid parts.

Company (ticker)	HQ	Revenue	Share	Key differentiator	Weakness vs Amkor
ASE Technology Holding (ASX / 3711.TW)	Kaohsiung, Taiwan	US\$20.55bn TTM; FY25 TWD645.4bn	44.6% (2024)	2.8x Amkor's revenue. Broadest portfolio: ATM plus EMS plus materials; VIPack platform; partnership with TSMC on panel-level process; capex reportedly raised to ~US\$10.5bn.	Heavy Taiwan concentration is the exact risk Western customers are diversifying away from. EMS segment dilutes group margin. Its scale advantage in cost is real but its geographic answer is worse than Amkor's.
Amkor Technology (AMKR)	Tempe, Arizona, USA	US\$7.46bn TTM	15.2% (2024)	Only scale OSAT outside the Taiwan cluster; US domicile; 10-year TSMC agreement; US\$1.5bn NVIDIA prepaid partnership; Apple anchor for Arizona; S-SWIFT and S-Connect HDFO platforms.	(Subject company)
JCET Group (600584.SS)	Jiangyin, China	CNY38.71bn TTM (~US\$5.4bn)	12.0% (2024)	Largest Chinese OSAT; owns former STATS ChipPAC assets in Singapore and Korea; CNY7.8bn new Shanghai advanced packaging plant announced Jun 2026; captive domestic demand from China's Big Fund.	Structurally excluded from US and EU leading-edge AI packaging by export controls and customer diversification. TTM revenue growth of +0.7% versus Amkor's +17.9% shows the export-control ceiling.
Tongfu Microelectronics (002156.SZ)	Nantong, China	US\$3.32bn (2024)	8.0% (2024)	Majority owner of AMD's former Suzhou and Penang assembly and test operations, giving it a structural position in AMD's back end.	Extreme single-customer concentration on AMD. No US or European footprint. Same export-control ceiling as JCET on the highest-value work.
Powertech Technology (6239.TW)	Hsinchu, Taiwan	TWD~70.6bn TTM (~US\$2.3bn, stale)	5.5% (2024)	The memory packaging and test specialist; direct beneficiary of HBM and DDR5 volume; deep relationships with Micron and the Korean memory makers.	Memory-cycle concentrated and largely absent from logic 2.5D. One-fifth of Amkor's scale with a narrower technology ladder.
HT-Tech / Tianshui Huatian (002185.SZ)	Tianshui, China	n/d (est. ~US\$2.0bn 2024)	4.8% (2024)	Fastest-growing top-ten OSAT in 2024 (+26%); heavily subsidised domestic expansion.	Mainstream-weighted; minimal presence in Western AI supply chains; technology ladder well below S-SWIFT class.
King Yuan Electronics (2449.TW)	Hsinchu, Taiwan	n/d	2.2% (2024)	Pure-play test house; the reference name for CoWoS-class advanced test capacity.	Test only - no packaging. Competes with only 12% of Amkor's revenue base and cannot offer turnkey.
Hana Micron (067310.KQ)	Asan, South Korea	n/d	2.2% (2024)	Korean memory packaging, closely tied to SK hynix HBM volume.	Sub-scale, single-country, single-end-market. No 2.5D logic capability.
TSMC 3DFabric (in-house)	Hsinchu, Taiwan	n/a - captive	n/a	Not an OSAT, but the most important competitor. CoWoS and InFO are integrated with the foundry step, letting TSMC sell packaging as part of a one-stop leading-edge offer.	This is the threat, not the weakness. See moat discussion below.

Every share figure above is TrendForce's 2024 estimate and the combined top-ten revenue base was US\$41.56bn in that year. They are the most consistent cross-company set available but they are one vendor's methodology and should be read as directional. Note the internal consistency check: Amkor's 15.2% share on a US\$41.56bn top-ten base implies US\$6.3bn, which matches its reported FY2024 revenue of US\$6,318m almost exactly.

Amkor's moat has three layers and one of them is much weaker than it looks. The strongest is qualification lock-in. A package is qualified per customer, per product family, per site, against JEDEC reliability standards, and moving a qualified high-volume package to a second supplier is typically a twelve-to-twenty-four-month programme with real yield risk. That is why customer relationships in this industry persist for decades and why the top ten customers are still 66% of revenue. The second is process know-how in areas that do not transfer through equipment purchases: warpage control during thermal assembly of large modules, capillary underfill on fine-pitch bumps, mold-side bumping, and semi-additive-process RDL at 2-micrometre line and space. Buying the same stepper does not buy the recipe. The third and weakest layer is geography. Being the credible non-Taiwan option is genuinely valuable right now, and it is what won the TSMC and NVIDIA agreements - but it is a policy-dependent moat, not a technical one, and ASE can build in Arizona too.

The most credible threat is TSMC's own 3DFabric platform. The logic is straightforward: the interposer and the chip-on-wafer step are physically adjacent to the foundry process, TSMC already owns the customer relationship at the design stage, and by bundling CoWoS with leading-edge wafers it captures the highest-value portion of the back end and leaves OSATs the overflow and the lower-margin outer assembly. Amkor's counter is not to fight this - it is to be TSMC's chosen partner, which is precisely what the ten-year Arizona agreement signed in June 2026 achieves. That converts the largest competitive threat into a customer relationship, but it also means Amkor's advanced packaging position is now partly held at TSMC's discretion. Investors should be clear-eyed that this is a dependency dressed as a partnership. The secondary threat is ASE simply out-spending Amkor: a capex programme reportedly around US\$10.5bn against Amkor's US\$2.5-3.0bn compounds a scale gap that is already 2.8-to-1 on revenue.

5 MANAGEMENT & GOVERNANCE

ELI5 — Who controls this company

Amkor is a public company that is effectively still family-run. The founder's family owns roughly half the shares, the chairman is the founder's daughter, and the founder himself and his son sit on the board. That means minority shareholders cannot outvote the family on anything. It is not automatically bad - family control can mean genuinely long time horizons, which suits a business that plants factories that take five years to pay back - but it does mean an investor is a passenger, and it is worth watching whether the family is buying or selling.

Person / item	Detail	Assessment
Kevin Engel, President & CEO	Appointed effective 1 January 2026. Joined Amkor August 2004 via the Unitive Electronics acquisition; nearly 30 years in the industry, over 20 at Amkor. Previously EVP and COO (Feb-Dec 2025), EVP Business Units (2023-25), and Corporate VP of the Flip Chip / Wafer Level business unit (2020-23). Engineering leadership at Unitive Advanced Semiconductor Packaging and National Semiconductor before Amkor. Age 54.	Unusually well matched to the moment. The CEO's own operating history is the flip chip and wafer-level franchise that is now the growth engine. Internal promotion after a formal succession process, with one year as COO first - low execution-discontinuity risk. Too early to score guidance accuracy: only two prints as CEO.
Giel Rutten, former CEO	CEO June 2020 to December 2025; retired voluntarily, remained on the board, advised through March 2026. Physics and chemistry background (Nijmegen); Philips and NXP career.	Credited by the chairman with orienting Amkor toward advanced packaging and HPC/AI. The strategic pivot that underwrites this thesis was set under Rutten; Engel inherits and executes it.

Person / item	Detail	Assessment
Megan Faust, CFO	Corporate VP and CFO. Delivered the Q2 2026 call detail on mix, Vietnam SiP migration and utilisation.	Disclosure quality is high by OSAT standards: cost of sales is broken out into materials, labour, depreciation and other manufacturing every quarter, which is what allows the margin attribution in this report.
Susan Y. Kim, Chairman	Chairman of the Board since September 2024, succeeding her father James J. Kim as he stepped back from the executive chairmanship. Directly holds 6,110,494 shares plus very large indirect holdings through trusts, GRATs, Sujochil LP and Sujoda Investments LP.	Family chairmanship alongside a non-family CEO is the standard structure here and has been stable.
Insider / family ownership	Kim family and related trusts and entities beneficially owned 122,666,110 shares, about 49.38% of the 247,872,518 shares outstanding, per Schedule 13D/A dated May 2026. This is down from approximately 58.2% reported in March 2021.	Working control without a dual-class structure - all common stock, one vote. Preferable to a dual-class arrangement, but 49.4% is still effective control of every shareholder vote.
Recent insider transactions	February 2026: secondary offering of 10 million shares by the Kim family, with a 180-day lock-up on the remainder - no proceeds to the company. July 2026: James J. Kim exercised 450,000 options at US\$9.86 and US\$9.48 (reported value ~US\$25.8m); the Form 4 was not marked as a Rule 10b5-1 plan transaction. Multiple Form 144 filings in July 2026.	FLAG. A steady, disclosed reduction of family stake into strength. The February lock-up expired around mid-August 2026, which removes the formal restraint on further sales. Treat further secondaries as a live overhang, not a surprise.
Share pledging	A secured margin line of up to US\$250m from JPMorgan to Kim Capital Partners - KCP, LLC, backed by a pledge of 16,710,668 Amkor shares and guaranteed by Susan Y. Kim and a related trust; loans maturing May 2028.	FLAG. Roughly 6.7% of shares outstanding pledged as loan collateral by the controlling family. In a sharp drawdown a margin call could force sales into a falling market. This is a genuine, if second-order, governance concern.
Capital allocation	Dividend initiated Q3 2020, raised every year since (US\$0.170 to US\$0.334 per share annualised). US\$300m share repurchase authorised in Q1 2026. Stated policy: return 40-50% of free cash flow; long-term net debt to EBITDA target of 1.5x or below. FY2026 capex guided to US\$2.5-3.0bn.	Coherent but internally strained in 2026: a 40-50% FCF return policy means little when TTM FCF is negative US\$172m. The buyback and dividend are being funded from the balance sheet and customer prepayments while the capex programme runs, not from operating surplus.
Board independence	Founder James J. Kim (former executive chairman) and John T. Kim have served as executive chairman and executive vice chairman respectively; Susan Y. Kim chairs; former CEO Giel Rutten remains a director.	Multiple family and former-executive seats. Independent-director oversight exists but the balance of the board is not what a governance screen would score well. Combined with 49.4% control, minority protection rests on fiduciary duty rather than voting arithmetic.

Overall assessment: competent and aligned on operations, partially misaligned on ownership. The operating team is deep in exactly the technology that matters, disclosure is better than peer average, and the strategic bets - Arizona, TSMC, NVIDIA, Vietnam - are the right bets. The alignment question is different: the controlling family has reduced from 58.2% to 49.4% since 2021, sold ten million shares into a strong tape in February 2026, exercised large option tranches in July 2026, and pledged 6.7% of the company against a margin facility. None of that is improper and all of it is disclosed. But an investor buying the advanced-packaging story is buying alongside a control block that has been a consistent net seller.

6 FINANCIAL TRAJECTORY

ELI5 — Reading an OSAT income statement

Amkor's factories cost the same to run whether they are busy or idle - the machines still depreciate, the clean rooms still need power, the technicians still get paid. So the single most important number is how full the factories are. When they are 90% full, an extra dollar of revenue drops almost straight to profit; when they are 60% full, the company barely breaks even. This is why Amkor's gross margin swings from 20% to 14% and back on revenue moves of only 10-15%. It is a fixed-cost leverage machine, not a pricing machine.

Annual trajectory (US\$m unless stated):

Metric	FY2021	FY2022	FY2023	FY2024	FY2025	TTM Jun-26
Revenue	6,138	7,092	6,503	6,318	6,708	7,458
Revenue growth	+21.5%	+15.5%	-8.3%	-2.9%	+6.2%	+17.9%
Advanced products	4,409	5,368	5,033	5,174	5,556	6,192
Mainstream products	1,729	1,724	1,470	1,143	1,152	1,266
Advanced % of revenue	71.8%	75.7%	77.4%	81.9%	82.8%	83.0%
Gross profit	1,226	1,330	943	933	939	1,157
Gross margin	20.0%	18.8%	14.5%	14.8%	14.0%	15.5%
Operating income	763	897	470	438	467	644
Operating margin	12.4%	12.7%	7.2%	6.9%	7.0%	8.6%
Net income	643	766	360	354	374	555
Diluted EPS (US\$)	2.62	3.11	1.46	1.43	1.50	2.23
Operating cash flow	1,121	1,099	1,270	1,089	1,096	1,195
Capital expenditure	(780)	(908)	(749)	(744)	(905)	(1,367)
Free cash flow	342	190	521	345	191	(172)
Net cash / (debt)	(208)	(138)	301	402	474	(35)

Two patterns dominate this table. First, the mix-versus-margin divergence already flagged: advanced share climbed 11 percentage points from FY2021 to TTM while gross margin fell 4.5 points and has only partially recovered. Second, free cash flow has turned negative for the first time in the visible history, not because operations deteriorated - operating cash flow is at a five-year high of US\$1,195m - but because capex jumped 51% year on year to US\$1,367m on a trailing basis and is guided to roughly double again for the full year. Net cash of US\$474m at the end of FY2025 has become a net debt position of US\$35m by June 2026, with total debt rising from US\$1,517m to US\$2,547m.

Quarterly trajectory (US\$m unless stated):

Metric	Q2 2025	Q3 2025	Q4 2025	Q1 2026	Q2 2026	Q3 2026 guide
Net sales	1,511	1,987 (derived)	1,888	1,685	1,898	1,950 - 2,050
Growth y/y	n/d	n/d	+16%	+27%	+26%	+0.7% at midpoint
Growth q/q	n/d	+31%	-5%	-11%	+13%	+5.4% at midpoint
Gross margin	12.0%	n/d	n/d	14.2%	16.8%	18.5% - 19.5%
Operating income	92	n/d	n/d	100	200	n/d
Operating margin	6.1%	n/d	n/d	6.0%	10.5%	n/d
Net income to Amkor	54	n/d	172	83	174	180 - 205
Diluted EPS (US\$)	0.22	0.51 (est.)	0.69	0.33	0.70	0.72 - 0.82
EBITDA	259	n/d	n/d	285	400	n/d
Advanced products	1,228	n/d	n/d	1,372	1,557	n/d
Mainstream products	283	n/d	n/d	313	341	n/d
Top 10 customers	72%	n/d	n/d	68%	66%	n/d
Materials % of sales	52.9%	n/d	n/d	53.5%	52.6%	n/d
Depreciation % of sales	9.6%	n/d	n/d	9.3%	8.6%	n/d

The Q3 2025 revenue figure is derived, not disclosed as a discrete line in the sources used: FY2025 revenue of US\$6,708m less first-half 2025 revenue of US\$2,833m (from the Q2 2026 comparative six-month column) less Q4 2025 revenue of US\$1,888m gives US\$1,987m. Two independent sources confirm the Q4 figure. This derivation matters more than it sounds, because it reframes the entire Q3 2026 guide. Q3 2025 at roughly US\$1,987m was the largest quarter in Amkor's history - larger than the widely reported 'record' Q2 2026 of US\$1,898m, which the company itself correctly described only as a record second quarter. Against that base, a Q3 2026 guide of US\$2.0bn at the midpoint is approximately flat year on year, versus consensus at roughly US\$2.12bn. That, and not the beat, is why the shares fell 6.5% on the print despite EPS of US\$0.70 against a US\$0.47 consensus.

The offsetting composition inside that guide is the actual news. Management expects computing revenue to grow approximately 30% sequentially in Q3 2026 while communications declines by a high single-digit percentage - a departure from normal seasonality caused by the migration of system-in-package production to Vietnam, memory supply constraints, and changed customer build patterns. The SiP headwind is expected to persist into Q4 2026 and the first half of 2027. So the flat headline masks a substantial internal rotation from a lower-margin mobile SiP book into a higher-margin compute book, which is exactly why gross margin steps up 250 basis points at the midpoint even as revenue growth stalls. An investor who models the top line will conclude the story is over; an investor who models the mix will conclude it is accelerating.

Balance sheet items that matter (as at 30 June 2026):

- Cash and short-term investments US\$2,512m against total debt of US\$2,486m (US\$151m current, US\$2,335m long-term). Effectively net-debt-neutral, versus US\$474m net cash six months earlier.
- US\$1,150m of long-term debt raised in H1 2026, with US\$56m paid for capped call transactions - the signature of a convertible note issue. Convertible instruments create potential dilution above the conversion price and the capped call adds counterparty exposure; the company lists both as explicit risk factors.
- Capital expenditures payable rose from US\$244m to US\$621m, meaning a further US\$377m of committed capex is already on the balance sheet as a liability but not yet through the cash flow statement.
- Property, plant and equipment net rose from US\$3,871m to US\$4,479m in six months, which will carry through into a materially higher depreciation charge from 2027 onward.
- Long-term restricted cash rose from US\$68m to US\$187m, consistent with government-incentive and facility-related escrow arrangements.
- The US\$1.5bn NVIDIA agreement was announced on 23 July 2026, after the balance sheet date. The prepayment component is therefore not in these figures and should appear from Q3 2026 - watch whether it lands as deferred revenue, a contract liability, or a capex offset, because the accounting treatment changes reported margin.
- Goodwill is immaterial at US\$17m; there are no meaningful impairment risks embedded in the asset base.
- Available liquidity was reported at approximately US\$4.1bn as at March 2026. Management targets long-term net debt to EBITDA of 1.5x or below, against TTM EBITDA of roughly US\$1.3-1.4bn.

7 CATALYSTS & RISKS

Catalyst	Timing	Impact	Probability
Q3 2026 print and Q4 guide	26 Oct 2026 (est.)	The single highest-signal event. Delivery of 18.5-19.5% gross margin would confirm mix-driven margin expansion is real and repeatable; the Q4 guide reveals whether compute growth can carry margin through a second quarter of communications decline.	High

Catalyst	Timing	Impact	Probability
NVIDIA prepayment first appears in accounts	Q3 2026	Confirms cash timing and accounting treatment of the US\$1.5bn agreement; materially de-risks the Arizona funding profile if recognised as a contract liability against capex.	High
Kim family lock-up expiry / further secondary	From ~Aug 2026 onward	The 180-day lock-up from the February 2026 secondary has lapsed. A further placement would be a supply overhang; conversely, a decision not to sell would be a genuine positive signal from the control block.	Medium
US\$300m buyback execution	H2 2026 - 2027	Modest at ~2% of market cap, but the pace of execution is a direct read on management's confidence in funding capex without further debt.	Medium
Arizona Phase 1 construction milestones	Through mid-2027	First manufacturing building targeted for completion around mid-2027; production from early 2028. Phase 1 is described as fully committed. Milestone slippage would push the 2028 revenue start and extend the negative-FCF window.	Medium
Additional CHIPS Act disbursement tranches	2026 - 2027	Up to US\$400m of direct funding was approved. Tranche receipts reduce net capex and appear in restricted cash and investing lines.	Medium
Completion of SiP migration to Vietnam	H1 2027	Removes the single largest identified revenue headwind. Until then, communications revenue is structurally depressed by an internal transfer, not by lost share.	High
TSMC Arizona fab ramp pulling Amkor volume	2027 - 2028	The ten-year agreement establishes the framework for TSMC to procure advanced packaging and test from Amkor in Arizona. Volume follows TSMC's own Arizona ramp, not Amkor's schedule.	Medium
New hyperscaler custom-ASIC packaging win	2026 - 2027	Would broaden the compute book beyond NVIDIA and AMD and reduce the concentration of the AI thesis in two customers.	Low to Medium
Substrate cost pass-through failure	H2 2026	Negative catalyst. If the Ajinomoto and laminate increases compress rather than pass through, the Q3 gross margin guide is at risk on the materials line specifically.	Medium

Key risks

TSMC captures the value it currently subcontracts. TSMC's 3DFabric platform - CoWoS-S with silicon interposers, CoWoS-L with embedded bridges, and InFO fan-out - is sold bundled with leading-edge wafer capacity, and TSMC owns the customer relationship from the design stage. Every incremental unit of CoWoS capacity TSMC brings online is a unit that does not go to Amkor's 2.5D or S-SWIFT lines. Amkor's mitigation is the ten-year Arizona agreement, which converts TSMC from a competitor into a customer - but the framework means TSMC decides how much to procure and when. If TSMC's own Arizona packaging capability matures faster than expected, the volume that flows to Amkor's Peoria facility from 2028 could be well below the capacity being built for it today. Amkor also buys silicon interposers from the same company. This is the structural risk in the name and it is not hedgeable by an investor.

The Vietnam SiP migration removes real revenue for at least four quarters. Management has explicitly guided communications revenue down a high single-digit percentage sequentially in Q3 2026, against normal seasonality, because system-in-package production is being physically relocated to Vietnam. The headwind is expected to continue into Q4 2026 and the first half of 2027. During an asset transfer the company runs underutilised capacity at both the origin and destination sites simultaneously, which is the worst possible condition for a fixed-cost business. Communications was 42% of Q2 2026 revenue, so this is not a rounding error. The specific exposure is the iOS ecosystem SiP book, which grew double digits sequentially in Q2 2026 - the revenue is not lost, but the transition risk is execution risk on Amkor's own factories, and any yield or qualification slip in Vietnam turns a timing problem into a share problem.

Android and memory supply. Android revenue declined 20% sequentially in Q2 2026, which management attributed to memory supply dynamics rather than end demand. Amkor packages what customers can source; when DRAM and NAND allocation tightens, handset makers cut builds and Amkor's assembly volumes fall with roughly one quarter of lag and no ability to influence the outcome. With memory pricing and allocation currently driven by HBM crowding out commodity DRAM capacity, this is a persistent rather

than transient condition, and it hits the mainstream and communications books hardest - exactly the parts of the business that carry the lowest margin and therefore the least room to absorb underutilisation.

Capital intensity converts into a depreciation wall in 2027-28. FY2026 capex of US\$2.5-3.0bn against a revenue base of roughly US\$7.5-7.8bn is 33-40% capital intensity, versus 13.5% in FY2025 and management's stated long-term target of the mid-to-high teens. As illustrative arithmetic: US\$2.75bn of additions depreciated over approximately seven years adds roughly US\$390m of annual depreciation at full run rate. On a hypothetical FY2028 revenue of US\$9bn that is about 4.3 percentage points of gross margin that must be absorbed by volume before any margin expansion is visible. Depreciation is already 8.6% of sales. The Arizona asset in particular generates no revenue until 2028 while depreciating from the moment it is placed in service. This is the mechanism by which a good strategic decision produces several years of poor reported returns.

Ajinomoto's monopoly on the film inside every substrate. Ajinomoto Build-up Film is estimated at over 95% share of the dielectric used in flip-chip substrates, and a roughly 30% price increase was announced effective Q3 2026, alongside separate ~30% copper-clad laminate increases from Resonac and Mitsubishi Gas Chemical. Materials are 52.6% of Amkor's net sales. Substrate lead times have extended to an estimated 20-30 weeks against a 12-16 week norm, and the supply-demand gap is reported to extend to end-2027. This is a dual risk: a cost risk if Amkor cannot pass it through, and a volume ceiling risk if substrate availability - not Amkor's own capacity - becomes the binding constraint on how much AI packaging it can ship. No qualified alternative supplier exists at scale.

Customer concentration and the AI two-name problem. Top-ten customers were 66% of Q2 2026 revenue. That is improving - it was 72% a year earlier - but the improvement is arithmetic dilution from growth, not diversification. More pointedly, the entire compute thesis currently rests on NVIDIA and AMD, with Apple as the anchor customer for Arizona. Apple's historical relationship is in mobile SiP, which is the book currently being relocated. A design loss, an in-sourcing decision, or a shift of packaging allocation at any one of these three would be immediately material, and Amkor has no backlog: the company's own risk factors note the absence of backlog and the short-term nature of customer commitments.

Structural price erosion is a disclosed feature of the industry, not a cyclical accident. Amkor lists 'the historical downward pressure on the prices of our packaging and test services' as a standing risk factor. Chinese OSATs - JCET, Tongfu and HT-Tech - grew at three to eight times the industry rate on the back of Big Fund and provincial subsidy, and JCET has committed a further CNY7.8bn to a Shanghai advanced packaging plant. They are largely excluded from Western leading-edge AI work today, but they compete directly for the mainstream wirebond and mid-range flip-chip volumes that are still 17% of Amkor's revenue, and subsidised competitors do not need to earn a return on capital. Any easing of export controls would extend that pressure up the technology ladder.

Control-block supply and pledged shares. The Kim family has reduced from 58.2% in 2021 to 49.38% as of May 2026, sold 10 million shares in a February 2026 secondary whose 180-day lock-up has now lapsed, and pledged 16,710,668 shares - about 6.7% of shares outstanding - as collateral for a US\$250m margin facility maturing May 2028. In a sharp drawdown, forced selling into a falling market is a tail risk that most minority holders do not price. Separately, with 49.4% held, no contested corporate action, activist campaign or premium takeover can proceed without family consent.

8

VALUATION CONTEXT

ELI5 — What the comparison is really testing

All four companies in the table below do broadly the same job. So if one of them trades at half the earnings multiple of another, the market is saying something specific: either it expects that company's profits to grow more slowly, or it thinks those profits are lower quality - earned on borrowed money, or on assets that will need replacing soon. Amkor is the cheapest of the scale players on forward earnings. The job of this section is to work out whether that is an opportunity or an accurate assessment.

Company	Market cap	Revenue (TTM)	P/E (TTM)	Forward P/E	Revenue growth	End-market exposure
Amkor Technology (AMKR)	US\$13.8-13.9bn	US\$7.46bn	25.0x	20.3x	+17.9% TTM	Communications 42%, computing 22%, automotive/industrial 22%, consumer 14% (Q2 2026)
ASE Technology Holding (ASX / 3711.TW)	US\$83-86bn (see log)	US\$20.55bn	45.1x	27.7x	+8.4% FY2025, accelerating in 2026	ATM (assembly, test, materials) plus a large EMS segment; leading-edge advanced packaging plus broad mainstream
JCET Group (600584.SS)	CNY135.8bn (~US\$19.0bn)	CNY38.71bn (~US\$5.41bn)	82.2x	49.6x	+0.7% TTM	China domestic consumer, communications, automotive; AI PC and mid-range smartphone platforms; excluded from Western leading-edge AI
Powertech Technology (6239.TW)	TWD209-269bn (~US\$6.7-8.6bn)	TWD~70.6bn (~US\$2.26bn, stale to Q3 25)	31.6x	19.7x	-6.2% on stale TTM basis	Memory-concentrated: DRAM, NAND, HBM packaging and test; limited logic 2.5D

Multiple caveats apply and are logged in Appendix A. ASE's US-listed ADS represents multiple common shares, so market capitalisation figures diverge across providers depending on the share count used; the range shown reconciles the reported US\$83.5bn figure from mid-July 2026 against the 12 August 2026 ADS close. JCET's market cap has more than doubled in twelve months on a 52-week range of CNY34.46 to CNY113.87, so any single-day figure is close to meaningless - the P/E of 82x sits on TTM earnings that grew 0.5%. Powertech's aggregator data is materially stale, with TTM revenue running only to Q3 2025 and market cap figures ranging from TWD163bn to TWD269bn across providers; the range shown is honest about that dispersion rather than resolving it by picking a source.

The headline is that Amkor is the cheapest scale OSAT on forward earnings at approximately 20x, against ASE at approximately 28x and JCET at approximately 50x. The discount is defensible on three grounds and questionable on one. Defensible: Amkor's gross margin of 15.5% on a trailing basis is structurally below ASE's group profitability, its free cash flow is negative while ASE's is not, and its revenue base is 36% the size of ASE's with a narrower advanced-packaging portfolio. Questionable: Amkor's TTM revenue growth of 17.9% is more than double ASE's FY2025 rate and roughly twenty-five times JCET's, and its margin trajectory - 12.0% to 16.8% to a guided 19.0% at the midpoint over five quarters - is the steepest in the group.

Bull case

The bull case is that 2026 is the year Amkor stops being a cyclical assembler and becomes a contracted advanced-packaging franchise, and the market has not repriced it yet. The evidence is in the margin sequence: 12.0% gross margin in Q2 2025, 14.2%, 16.8%, and a guided 18.5-19.5% for Q3 2026, which would be the best quarterly margin since the FY2021 peak of 20.0%. That is being delivered while the communications book is in a self-inflicted trough from the Vietnam transfer - so the compute business is carrying the whole margin expansion on its own. Computing is guided up approximately 30% sequentially in Q3. Behind it sit three contracted relationships no other non-Taiwanese OSAT has: a ten-year TSMC agreement, a US\$1.5bn prepaid NVIDIA partnership, and Apple as the anchor tenant for Arizona - all underwritten by up to US\$400m of CHIPS funding. If the SiP headwind clears in H1 2027 as guided and

compute keeps compounding, FY2027 revenue in the high-US\$8bn to US\$9bn range at a gross margin approaching 20% and an operating margin in the 12-13% area - both levels the company achieved in FY2021-22 - would generate earnings power meaningfully above the current TTM US\$2.23 per share. On today's price that would put the shares on a multiple in the low-to-mid teens on 2027 earnings, before the Arizona asset contributes anything at all. The shares are also roughly 42% below the 52-week high, so the entry point is not a momentum chase.

Bear case

The bear case is that Amkor is spending US\$2.5-3.0bn to rent a position in someone else's value chain, and the returns arrive after the depreciation does. Start with the growth optics: the Q3 2026 guide is approximately flat year on year against the toughest comp in company history, immediately after two quarters of mid-twenties growth, and it missed consensus by roughly 6%. The communications drag persists into H1 2027 by management's own guidance. Meanwhile trailing free cash flow is negative US\$172m, the net cash position of US\$474m at end-2025 has already become net debt, the company has issued convertible debt with attendant dilution, and roughly US\$390m of incremental annual depreciation is arriving in 2027-28 from assets that will not generate revenue until 2028. Structurally, Amkor is a price-taker in an industry whose own risk disclosures cite historical downward price pressure and the absence of backlog; it depends on a single supplier for a material in over half its cost base; and its largest strategic partner, TSMC, is simultaneously its most credible competitor and its interposer supplier. The controlling family has been reducing its stake and has pledged 6.7% of the company against a margin loan. At 20x forward earnings on 15.5% gross margins with negative free cash flow, the multiple already embeds the Arizona option - a de-rating toward the 8-10x P/E at which this business traded in FY2021-22 is what a cyclical repricing looks like, and the trigger would simply be one quarter in which mix fails to offset the volume decline.

9 WHAT MOVES IT NEXT - EARNINGS SIGNAL MAP

ELI5 — Why this table exists

You cannot read every line of every quarterly report across a coverage list, so the useful discipline is to decide in advance what single number you are waiting for from each company. Everything else in the release is noise until that number is checked. This table sets that trigger for Amkor and for the three peers whose prints move Amkor's read-across, so that on the morning of each release you know in thirty seconds whether the thesis is intact.

Company	Next earnings	Days away	The one metric	Why it matters
JCET Group (600584.SS)	21 Aug 2026, Q2 2026	8	Advanced packaging revenue growth versus the +0.7% TTM total, and any commentary on the Shanghai CNY7.8bn plant's target customers	The cleanest read on whether Chinese OSATs remain capped at mainstream work. If JCET's advanced book inflects, the export-control moat protecting Amkor's mid-range flip-chip volumes is narrower than assumed.
Amkor Technology (AMKR)	26 Oct 2026 (est.), Q3 2026	74	Q4 2026 gross margin guidance - specifically whether management holds at or above 19% through a second consecutive quarter of communications decline	The entire re-rating case is that compute mix can carry margin while the SiP book is in transit. Holding 19%+ into Q4 proves the mix effect is structural and makes FY2027 margin near the FY2021 peak credible. Guiding back below 18% says the Q3 step-up was a one-quarter utilisation artefact and the stock re-rates to its cyclical multiple.

Company	Next earnings	Days away	The one metric	Why it matters
Powertech Technology (6239.TW)	~27 Oct 2026 (est.), Q3 2026	75	HBM and advanced memory packaging capacity utilisation and 2027 capacity commitments	Powertech is the purest read on whether memory allocation is still crowding out commodity DRAM. That is the mechanism behind Amkor's 20% sequential Android decline, so Powertech's commentary tells you when Amkor's mainstream drag ends.
ASE Technology Holding (ASX)	~29 Oct 2026 (est.), Q3 2026	77	Advanced packaging and leading-edge revenue guidance for 2027, plus any confirmation of US capacity plans	ASE is the share benchmark and the capex benchmark. Confirmation of a US advanced-packaging build would directly attack the one part of Amkor's moat that is policy-derived rather than technical, and would be the most damaging single datapoint to the geographic-diversification thesis.

Prioritisation. JCET on 21 August is the first and cheapest information, but it is a read-across, not a position-changing event. The report that matters is Amkor's own on approximately 26 October, and within it, only one thing: the Q4 gross margin guide. Everything else - the revenue print, the EPS beat, the Arizona construction update, the NVIDIA prepayment accounting - is either already known or second-order. Amkor is currently being valued on a margin trajectory that has completed three of its five required steps. Q3's delivery of 18.5-19.5% is close to assured given it is one quarter of visibility on a mix already in the factories; the genuinely uncertain step is whether that level survives into Q4 with communications down for a second consecutive quarter. If it does, the FY2027 earnings power in the bull case above becomes underwritable. If it does not, this is a cyclical assembler with a large capex bill, and the appropriate multiple is much lower. Set the alert for 26 October and read the guidance paragraph before the results table.

A VERIFICATION LOG

Grading: CLEAN = confirmed against a primary filing or two independent sources. EST. = derived, modelled, or from a single vendor/consultancy source; directional only. FLAGGED = material inconsistency, stale vintage, or interested-party framing that the reader must weigh.

Claim	Grade	Basis and caveats
Q2 2026 net sales US\$1,898m; GM 16.8%; op. income US\$200m; diluted EPS US\$0.70; EBITDA US\$400m	CLEAN	Amkor 8-K earnings exhibit filed with the SEC, quarter ended 30 June 2026.
Q3 2026 guidance: sales US\$1.95-2.05bn, GM 18.5-19.5%, net income US\$180-205m, EPS US\$0.72-0.82; FY26 capex US\$2.5-3.0bn	CLEAN	Same 8-K, Business Outlook section.
TTM revenue US\$7,458m; GM 15.5%; op. margin 8.6%; net income US\$555m; EPS US\$2.23	CLEAN	stockanalysis.com (Fiscal.ai data), TTM to 30 June 2026, checked 13 Aug 2026.
FY2021-25 revenue, margin, capex, FCF and segment series	CLEAN	stockanalysis.com annual series; advanced/mainstream split cross-checks to the 8-K Selected Operating Data.
Q3 2025 revenue approximately US\$1,987m	EST.	DERIVED, not disclosed as a discrete figure in sources used: FY2025 US\$6,708m less H1 2025 US\$2,833m (8-K comparative) less Q4 2025 US\$1,888m. Q4 2025 confirmed by two sources. The conclusion that Q3 2026 guidance is roughly flat year on year depends on this derivation - verify against the FY2025 10-K before acting on it.
Q3 2025 diluted EPS US\$0.51	EST.	Single secondary source referencing a third-quarter print; quarter attribution not independently confirmed.
Q4 2025 revenue US\$1,888m; net income US\$171.8m; EPS US\$0.69	CLEAN	Two independent secondary sources agree.
Share price US\$55.59 (12 Aug 2026 close); market cap US\$13.8-13.9bn	CLEAN	stockanalysis.com real-time quote; share count 247,872,518 (13D/A, as at 21 Apr 2026) and 249,978k diluted (8-K).

Claim	Grade	Basis and caveats
52-week range US\$20.87 - US\$96.68	FLAGGED	Single secondary source dated late July 2026. A 4.6x intra-year range is plausible for this name in this cycle but has not been independently confirmed. Treat the 'roughly 42% below the high' framing in the bull case with corresponding caution.
P/E 25.0x TTM, forward 20.3x, P/S 1.85x	CLEAN	stockanalysis.com ratios page, current as at 13 Aug 2026.
Balance sheet: cash and ST investments US\$2,512m; total debt US\$2,486m; PP&E net US\$4,479m; capex payable US\$621m	CLEAN	8-K consolidated balance sheet at 30 June 2026. US\$1,150m long-term debt raised H1 2026; US\$56m capped call payments	CLEAN	8-K condensed cash flow statement. Convertible characterisation is inferred from the capped call line and the company's own convertible-note risk factors.
CEO Kevin Engel effective 1 Jan 2026; joined Amkor Aug 2004; prior COO, EVP Business Units, CVP Flip Chip/Wafer Level	CLEAN	Amkor 8-K dated 21 Oct 2025 filed with the SEC, plus company press release.
Kim family beneficial ownership 49.38% (122,666,110 of 247,872,518 shares)	CLEAN	Schedule 13D/A, May 2026. Prior 58.2% figure from the FY2021 DEF 14A proxy.
US\$250m JPMorgan margin line to Kim Capital Partners; 16,710,668 shares pledged; matures May 2028	CLEAN	Same Schedule 13D/A.
Feb 2026 secondary of 10m shares with 180-day lock-up; July 2026 option exercises of 450,000 shares at US\$9.86/US\$9.48	CLEAN	Company press releases and Form 4 filings.
US\$1.5bn NVIDIA multi-year partnership announced 23 July 2026, with prepayment supporting US capacity	CLEAN	Amkor investor-relations press release, corroborated by Reuters reporting.
TSMC 10-year Arizona advanced packaging agreement, June 2026	CLEAN	Joint TSMC/Amkor announcement; multiple independent confirmations.
Arizona: Peoria site, first building ~mid-2027, production early 2028, up to US\$400m CHIPS direct funding	EST.	Secondary sources aggregating the announcement; the original US\$2bn project figure predates the current capex plan and should not be used as the current committed number.
OSAT 2024 market shares: ASE 44.6%, Amkor 15.2%, JCET 12%, Tongfu 8%, PTI 5.5%, HT-Tech 4.8%, Hana 2.2%, KYEC 2.2%, ChipMOS 1.7%; top-ten revenue US\$41.56bn	EST.	TrendForce, single vendor, 2024 vintage. Internally consistent: 15.2% of US\$41.56bn implies US\$6.32bn, matching Amkor's reported FY2024 revenue. Two-year-old shares in a fast-moving market.
ASE market cap US\$83-86bn; TTM revenue US\$20.55bn; P/E 45.1x; forward 27.7x	FLAGGED	stockanalysis market cap of US\$83.48bn is dated 17 July 2026; the ADS closed at US\$39.28 on 12 Aug 2026. ADS-to-common ratio creates genuine dispersion across providers. Presented as a range, deliberately unresolved.
JCET market cap CNY135.76bn; TTM revenue CNY38.71bn; P/E 82.2x; forward 49.6x	FLAGGED	stockanalysis, cached 6 Aug 2026, on a day the stock moved +10%. 52-week range CNY34.46-113.87. Any point-in-time multiple for this name is close to uninformative.
Powertech market cap TWD209-269bn; TTM revenue TWD70.62bn; P/E 31.6x; forward 19.7x	FLAGGED	Materially stale. TTM revenue runs only to Q3 2025. Market cap figures span TWD163bn (stockanalysis), TWD209bn (TradingView) and an implied TWD269bn from a reported TWD363.50 close on 738.8m shares. Range presented with both endpoints; do not resolve by picking one.
ASE capex raised to approximately US\$10.5bn	EST.	Secondary reporting of a company statement; not verified against ASE's own filing.
Ajinomoto >95% ABF share; ~30% price increase effective Q3 2026; Resonac and MGC CCL increases ~30%	EST.	Multiple trade-press sources citing DigiTimes and Commercial Times. Directionally well corroborated; the precise share figure is an industry estimate.
ABF substrate lead times 20-30 weeks vs 12-16 normal; >12-layer substrate yields 60-70%; layer counts moving 3+3 to 13+13; AI GPU needs 1-2 substrates of 70x70mm+	EST.	Single trade source. Directional; useful for framing the intensity shift, not for modelling.

Claim	Grade	Basis and caveats
Advanced packaging ASP premium 3-10x traditional; advanced share of OSAT revenue ~15% (2020) to 25-30% (2026)	EST.	Vendor TAM-style figure from a market research publisher. Directional only, as house convention requires.
S-SWIFT specifications: 2 um line/space, 6 RDL layers, >1,000 I/O, Cu pillar to 30 um pitch; 2.5D logic-to-HBM spacing <100 um	CLEAN	Amkor technology pages, datasheets and a technical article authored by Amkor's VP of Advanced Package and Technology Integration.
Manufacturing footprint: Korea, Philippines, Vietnam, China, Japan, Malaysia, Taiwan, Portugal, USA	CLEAN	Company profile sources; consistent with the Nanium (Portugal) acquisition history disclosed in the 8-K.
Q3 2026 consensus revenue ~US\$2.12bn; Q2 consensus EPS US\$0.47 and revenue US\$1.81-1.82bn	EST.	Secondary aggregation of sell-side consensus; vintage is the day of the print. Consensus in this name is heavily guidance-anchored, so treat the 'miss' framing as a statement about the guide versus the plug, not about demand.
Management commentary: computing +30% q/q in Q3; communications down high single digits; SiP headwind into H1 2027; Android -20% q/q on memory supply; iOS SiP up double digits q/q	CLEAN	Q2 2026 earnings call, CEO Kevin Engel and CFO Megan Faust.
US\$300m buyback authorised Q1 2026; 40-50% FCF return policy; net debt/EBITDA target <=1.5x; US\$4.1bn liquidity at Mar 2026	EST.	Third-party summary of management commentary rather than the primary transcript. Directionally reliable; verify the buyback authorisation against the Q1 2026 8-K before modelling.
Illustrative depreciation arithmetic (~US\$390m incremental annual D&A; ~4.3pp of FY2028 gross margin)	EST.	Author's arithmetic on stated capex guidance and an assumed seven-year life. Not company guidance. Shown to size the mechanism, not to forecast.
Illustrative materials cost arithmetic (US\$120-240m, 1.5-3.0pp of gross margin)	EST.	Author's arithmetic combining the 3-6% finished-substrate pass-through estimate with annualised materials spend at 52.6% of sales. Not company guidance.
Next earnings dates: AMKR 26 Oct 2026; JCET 21 Aug 2026; PTI and ASE late Oct 2026	EST.	JCET date from stockanalysis. AMKR 26 Oct from a secondary earnings calendar and consistent with the company's Monday-after-quarter cadence; not yet confirmed by an Amkor press release. PTI and ASE dates are estimated from prior-quarter cadence and labelled as such in the table.

Corrections applied during verification: (1) the widely reported 'record quarterly revenue' framing for Q2 2026 was corrected to 'record second quarter' after deriving Q3 2025 revenue of approximately US\$1,987m - the company's own release says 'Record Second Quarter 2026', and several media summaries dropped the qualifier; (2) Amkor's CEO is Kevin Engel, not Giel Rutten, as several still-indexed reference pages state; (3) market caps for ASE, JCET and Powertech are presented as ranges rather than point estimates because provider figures diverge by more than 30% in each case.

B

ACRONYM GLOSSARY

Acronym	Full name
ABF	Ajinomoto Build-up Film
ADAS	Advanced Driver-Assistance Systems
ADS	American Depositary Share
AI	Artificial Intelligence
ASIC	Application-Specific Integrated Circuit
ASP	Average Selling Price
ATM	Assembly, Test and Materials (ASE segment)
BGA	Ball Grid Array
BT	Bismaleimide Triazine (substrate resin)
CCL	Copper-Clad Laminate

Acronym	Full name
CHIPS Act	Creating Helpful Incentives to Produce Semiconductors and Science Act (US, 2022)
CoWoS	Chip-on-Wafer-on-Substrate (TSMC advanced packaging)
CSP	Chip-Scale Package
D2D	Die-to-Die
DDR5	Double Data Rate 5 (memory standard)
DRAM	Dynamic Random-Access Memory
EBITDA	Earnings Before Interest, Taxes, Depreciation and Amortisation
EMIB	Embedded Multi-die Interconnect Bridge (Intel)
EMS	Electronics Manufacturing Services
EPS	Earnings Per Share
FCBGA	Flip Chip Ball Grid Array
FCCSP	Flip Chip Chip-Scale Package
FCF	Free Cash Flow
FOCoS	Fan-Out Chip on Substrate (ASE)
GPU	Graphics Processing Unit
GRAT	Grantor Retained Annuity Trust
HBM	High Bandwidth Memory
HDFO	High-Density Fan-Out
HPC	High-Performance Computing
IDM	Integrated Device Manufacturer
InFO	Integrated Fan-Out (TSMC)
I/O	Input/Output
IPD	Integrated Passive Device
JEDEC	Joint Electron Device Engineering Council (standards body)
L/S	Line and Space (interconnect pitch measure)
MSL	Moisture Sensitivity Level (JEDEC classification)
NAND	Not-AND (flash memory type)
OSAT	Outsourced Semiconductor Assembly and Test
P/E	Price-to-Earnings ratio
PP&E	Property, Plant and Equipment
QFN / QFP	Quad Flat No-lead / Quad Flat Package
RDL	Redistribution Layer
SAP	Semi-Additive Process (RDL fabrication)
SiP	System-in-Package
SLT	System-Level Test
SoC	System-on-a-Chip
S-Connect	Silicon Connect (Amkor bridge-based platform)
S-SWIFT	Substrate Silicon Wafer Integrated Fan-out Technology (Amkor)
SWIFT	Silicon Wafer Integrated Fan-out Technology (Amkor)

Acronym	Full name
TSV	Through-Silicon Via
TTM	Trailing Twelve Months
VIPack	Vertically Integrated Package (ASE platform)
WLCSP	Wafer-Level Chip-Scale Package
2.5D	Side-by-side die integration on a shared interposer
3DFabric	TSMC's combined 3D silicon stacking and advanced packaging platform

C DISCLAIMER

This document is prepared for internal research purposes only. It does not constitute investment advice, a recommendation, a solicitation, or an offer to buy or sell any security. In accordance with house convention it contains no price target and no buy, sell or hold rating. Figures are drawn from company filings, company disclosure, market data providers and industry press as at 13 August 2026; all material claims are graded in the Verification Log at Appendix A and items graded EST. or FLAGGED should be independently confirmed before being relied upon in an investment decision. Market data moves continuously and valuation figures will be stale on any subsequent date. Vendor market-share and total-addressable-market figures are directional estimates from single sources. The author holds no position in any security mentioned.
